

Precipitation at four cities, every TRAINING experiment — solid = emulator (5 members), dashed = CESM2
band = min-max across members. CESM2 members: hist 5, ssp370 5, aaer 10, ghg 10 — so band widths are NOT comparable between experiments.
Nearest gridpoint on the 192x288 grid.

Inset: r and RMSE [mm/day] between the two ENSEMBLE MEANS. Members are different realisations, so internal variability cannot correlate — r is the forced-signal agreement, r10 the same on 10-year means.
