

Near-surface temperature at four cities, every TRAINING experiment — solid = emulator (5 members), dashed = CESM2
band = min-max across members. CESM2 members: hist 11, ssp370 3, aaer 10, ghg 10 — so band widths are NOT comparable between experiments.
Nearest gridpoint on the 192x288 grid.

Inset: r and RMSE [°C] between the two ENSEMBLE MEANS. Members are different realisations, so internal variability cannot correlate — r is the forced-signal agreement, r10 the same on 10-year means.
