

Distribution over the LAST 20 YEARS of each training experiment — step = emulator, filled/dashed = CESM2
 hist ends 2014, ssp370 and the single-forcing runs end 2100, so the panels compare different periods per experiment.
 All members pooled: emulator 5 x 20 samples, CESM2 hist 11, ssp370 3, aaer 10, ghg 10 x 20.
 Inset: mean bias [°C], the sd ratio emulator/CESM2, and the Q-Q RMSE — the RMS gap between matched quantiles, which is a proper distance for unpaired samples where a pointwise RMSE would not be.

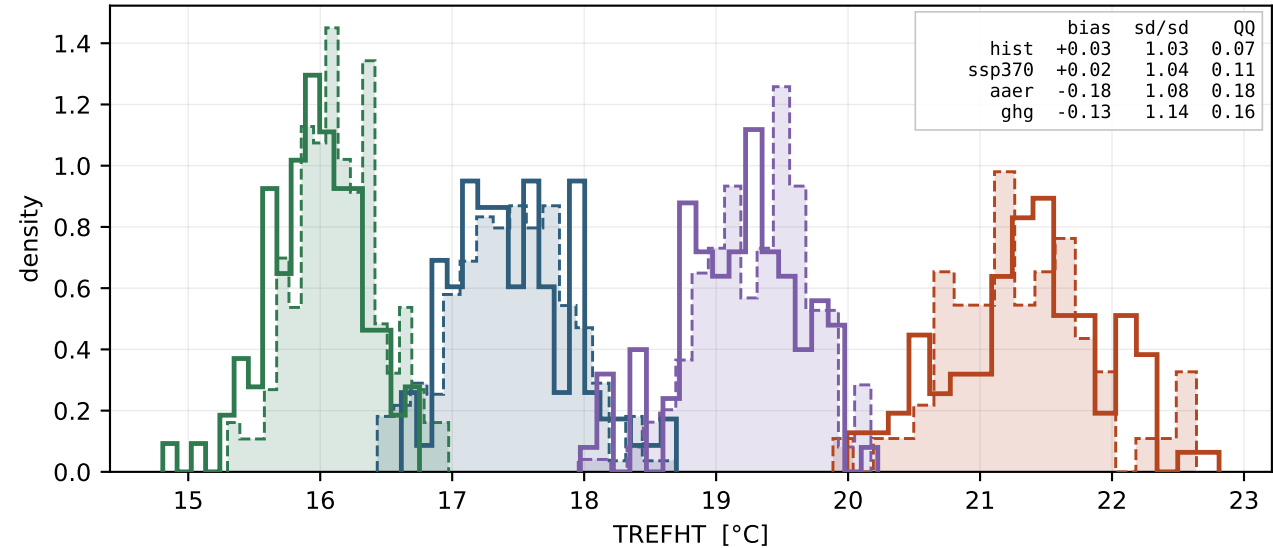

(a) Helsinki (cell +59.84, +25.00)

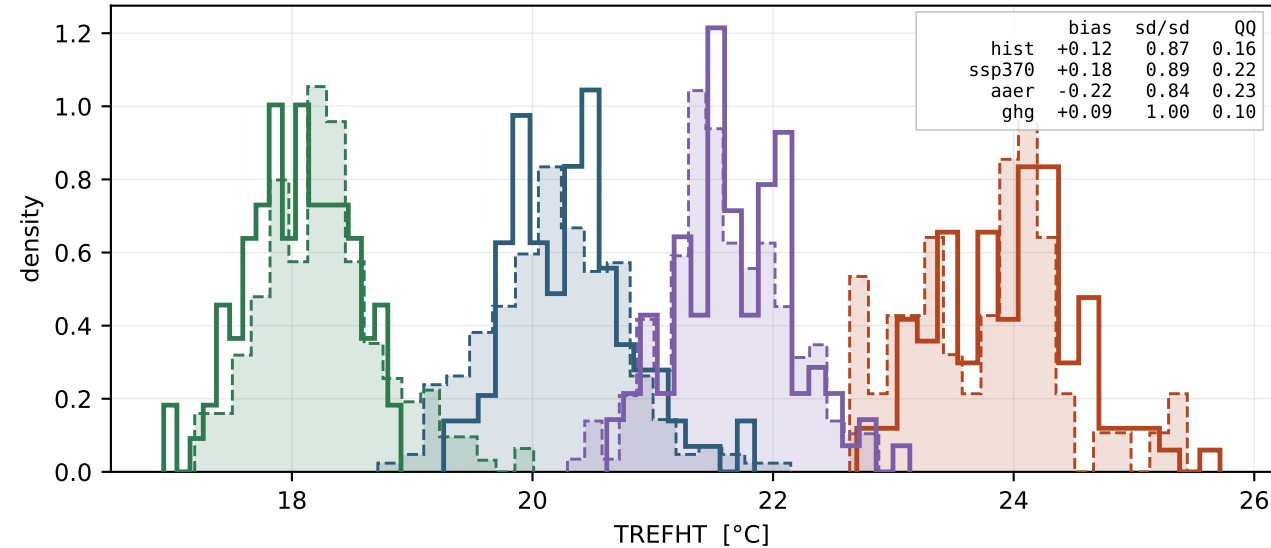

(b) Tokyo (cell +35.34, +140.00)

(c) Sydney (cell -33.46, +151.25)

(d) Sao Paulo (cell -23.09, -46.25)
