

Near-surface temperature at four cities, every TRAINING experiment — solid = emulator (5 members), dashed = CESM2
band = min-max across members. Member counts differ (CESM2: 11 hist, 10 aaer, 10 ghg, only 3 ssp370), so band widths
are not comparable between experiments. Nearest gridpoint on the 192x288 grid.

Inset: r and RMSE [°C] between the two ENSEMBLE MEANS. Members are different realisations, so internal variability cannot correlate — r is the forced-signal agreement, r10 the same on 10-year means.

— hist — emulator — ssp370 — emulator — aaer (GHG fixed at 1850) — emulator — ghg (aerosol fixed at 1850) — emulator
